

In the package.json file of nodejs projects, in the following section:

```
"dependencies": {  
  "slugify": "^1.4.5"  
},
```

This will tell nodejs to only tolerate minor and patch releases (within the major version 1). However, if we want even a safer dependency specification:

```
"dependencies": {  
  "slugify": "~1.4.5"  
},
```

The above code will make nodejs only tolerated patch releases within the same major and minor versions specified here (1.4).

Commands:

- To check outdated packages (that are in your package.json file), issue this command in your project folder:
 - npm outdated
- To update pkg:
 - npm update pkg_name
- uninstall pkg:
 - npm uninstall pkg_name

-
- ⇒ Never share your node_modules folder with other people (no need to do that). This folder is your dependency holder folder.
 - ⇒ If you have deleted the node_modules folder, you can get it back by (it installs with respect to package.json):
 - npm install
 - ⇒ Always share package.json and package-lock.json (for instance in github)
